TITLE

A Package for An Ostomy Appliance

BACKGROUND OF THE INVENTION

5 1. Field of the Invention

The present invention relates to a package for a collecting bag to be secured to the abdomen of a patient or to a body side ostomy member for collecting fluids or excretions emerging from an abdominal stoma and the preparation thereof.

10 In connection with surgery for a number of diseases in the gastro-intestinal or urinary tract a consequence is, in many cases, that the colon, the ileum or the ureter has been exposed surgically and the patient is left with an abdominal stoma, or, in nephrostomy or ureterostomy, the ureter or a catheter is exposed in the back or the chest region or abdominal region, and the effluents or waste products of
15 the body, which are conveyed through these organs, are discharged through the artificial orifice or opening and are collected in a collection bag, which is usually adhered to the skin by means of an adhesive wafer or plate having an inlet opening for accommodating the stoma/ureter/catheter. Also in connection with a fistula, the patient will have to rely on an appliance to collect the bodily material
20 emerging from such opening.

Ostomy appliances are well known. Such appliances may be two-piece or one-piece appliances. In both types of appliances, an adhesive barrier member (or base plate) is attached to the wearer's abdomen/back/chest. In case of a one-
25 piece appliance, a receiving member or bag is attached to the base plate. In case of a two-piece appliance, the adhesive barrier member forms part of a body side member and a receiving member or bag is attached releasably to the body side ostomy member for receiving exudates from the stoma.

30 When using one-piece appliances, the whole appliance, including the adhesive skin barrier securing the appliance to the skin is normally removed and replaced by a fresh appliance. When using two-piece appliances, the body side ostomy

member is left in place up to several days, and only the receiving member or bag attached to the body side member is replaced. The attachment means for attaching an ostomy receiving bag may e.g. be a system comprising matching coupling rings or matching flanges and adhesive surfaces engaging with and sealing
 5 against a flange area of the body side member.

A known major problem with such receiving bags is that it can be difficult to dispose of the used bag in a convenient and hygienic manner. Some ostomists will cut the used bags open, e.g. by cutting off an edge thereof and deposit the contents into a WC for flushing away and dispose or deposit the empty bag in a
 10 waste bin. Such disposal of used bags and the contents therein is indeed unhygienic and unpleasant for the user, and the problems with disposal of a used bag is even more pronounced if the user does not have access to normal toilet facilities, e.g. when travelling.

15

SUMMARY OF THE INVENTION

The present invention relates to a package for a disposable ostomy receiving bag.

20 The invention also relates to a method of producing a package for containing a disposable ostomy receiving bag.

The present invention is described with reference to use in connection with an ostomy collecting bag but other uses of the package overcoming corresponding
 25 problems are also considered a part of the invention, e.g. the use in connection with handling hygienic articles such as sanitary towels or diapers.

Brief Description of the Drawings

The invention is disclosed more in detail with reference to the drawings, in which
 30 Fig 1 shows a front view of a package of the invention comprising an ostomy appliance,

Fig 2 shows a first stage in a process for preparing a package of the invention containing an ostomy appliance.

Fig 3 shows a second stage in a process for preparing a package of the invention containing an ostomy appliance, and

- 5 Fig 4 shows a third stage in a process for preparing a package of the invention containing an ostomy appliance.

Detailed Description of the Present Invention

10 The present invention relates to a package for a disposable ostomy receiving bag, said package comprising a first compartment capable of accommodating a (fresh) ostomy receiving bag and a second compartment capable of accommo-

15 dating a used ostomy receiving bag, said second compartment being sealable so as to confine the receiving bag.

20 The bag of the invention facilitates the handling of fresh and used bags and renders the user more independent on immediate availability of a lavatory or toilet facilities when having to substitute a bag while being out of the daily where-

25 abouts. Thus, the invention renders it easy for an ostomate to carry a fresh bag in a discrete manner and also to handle the used bag in a safe and discrete manner reducing the risk of embarrassing situations in case of a leak liberating odour or the contents of the bag. This will increase the chances of living a more normal social life and increase the quality of life of the ostomate.

The package of the invention may be used for receiving bags for both one-piece and two-piece applications.

30 Suitable materials for a package of the present invention are thin flexible sheet materials, which are moisture resistant and impervious to liquids and preferably also odours, e.g. polyolefins such as polyethylene or polypropylene, EVA, polyvinylidene chloride, or chlorinated polyethylene or copolymers of PE and EVA or combinations of such foils. The walls of the bag may in a special embodiment be laminated with materials conventionally used in the production of ostomy appli-

ances such as non-woven materials of polyethylene, polypropylene or a polyester.

5 A suitable embodiment of a package is in the form of a bag having a closed end and an open end and having a first wall and a second wall, said bag having edges connecting the closed and open ends of the bag wherein the edges are folded so as to cover each a longitudinal strip of the first wall, said bag also being folded so that the closed end of the first wall is parallel to the open end of the first wall to form the first compartment. To prevent a fresh ostomy appliance confined
10 by the first compartment from falling out, the opposing sides of the first wall may be connected with releasable adhesive dots or a releasable label may be applied across the opening of the first chamber. In this embodiment, a relatively large bag which may accommodate a used bag with contents is also rendered suitable for accommodating a fresh receiving bag and, at the same time, ensures as high a
15 degree of discretion as it may e.g. be carried in a hand bag or a pocket. It is preferred that the material for a package of the invention is opaque for blurring the contents for improving the discretion when it is necessary to carry the package containing a used bag. Furthermore, the bag is easy to unfold without risk of damaging the walls of the bag compromising the later use for carrying the used
20 bag.

It is preferred that the closed end of the bag, in its folded position, leaves a part of the open end of the bag free as a flap capable of covering the inlet opening of the compartment when folded as this flap will protect a fresh bag against me-
25 chanical damage when stowed in a hand bag or a pocket.

In accordance with another preferred embodiment, one of the walls of the open end of the bag (the one being at the outside after folding the bag) is extended beyond the edge of the other wall forming an extended flap, which may have a
30 general rectangular, triangular or oval shape or the shape of a part of a circle.

The safety against damage and unintended catching of the bag is increased when the flap and the outer surface of the second wall forming the first compartment are provided with means for releasable attachment of the flap to the surface of the wall. Such means may be a releasable adhesive sealing or a peelable weld
 5 seam. The sealing of the first compartment may preferably be effected using an adhesive label placed on the flap. Such a label may also be used in a manner known per se for carrying information identifying the product.

10 Due to the stiffness of the double folding and the supporting effect of the ostomy appliance, an unintended unfolding of the bag and opening of the first compartment and uncovering the ostomy appliance may be ensured alone by applying an adhesive label without having to rely on further sealing of the package of the invention.

15 The second compartment of the package is advantageously sealed by tying a knot on a part of the open end or using another suitable sealing means such as a clamp known per se for sealing an ostomy bag or an adhesive sealing which is preferably covered by a protecting release liner made from a suitable material
 20 such as polyethylene or a siliconised paper to be removed before use or a reusable adhesive placed on the flap. When a reusable adhesive is used on the flap for closing the first compartment, this may also be used for closing the second compartment in which the used receiving bag is then safely confined.

25 The package may be made from a bag made from a thermoplastic material in a manner known per se. It is preferred that the edges are folded so as to cover each a longitudinal strip of the first wall having a width of from 15% to 50% of the total width of the bag, preferably from 25% to 40% of the total width of the bag, e.g. from 30% to 35% which together with the stiffness of the ostomy appliance
 30 will be sufficient to prevent an unintended unfolding of the bag and opening of the first compartment and uncovering the ostomy appliance when sealing the first compartment using an adhesive label.

A safe and discrete depositing of the used bag when having to rely on using a waste bin is secured when the bag is made from a material being substantially impervious to odour. A suitable such material is a material conventionally being used for production of ostomy appliances, e.g. the ones mentioned above.

5

In another aspect the invention relates to a method of producing a package containing a disposable ostomy receiving bag, said package comprising a first compartment capable of accommodating a (fresh) ostomy receiving bag and a second compartment capable of accommodating a used ostomy receiving bag, said
10 second compartment being sealable so as to confine the receiving bag, said method comprising placing an ostomy appliance on a bag having a closed end and an open end and having a first wall and a second wall and said bag having edges connecting the closed and open ends of the bag wherein the edges are folded so as to cover each a longitudinal strip of the first wall and a part of the
15 ostomy appliance, and subsequently folding the closed end of the first wall of said bag so that is parallel to the open end of the first wall and covers the folded strips and the ostomy appliance to form the first compartment.

It is preferred that the bag is folded so that the closed end of the bag, in its folded
20 position, leaves a part of the open end of the bag free as a flap which is then folded to cover the inlet opening of the first compartment.

In a preferred embodiment, the flap is then secured to the outer surface of the second wall for closing the first compartment by means for releasable attachment
25 of the flap to the surface of the wall.

Description of the Preferred Embodiments

The invention is now explained more in detail with reference to the drawings showing preferred embodiments of the invention.

30

Reference is made to Figures 1 and 4 showing a front view of an embodiment of a package of the invention is in the form of a bag 1 having a closed 2 end and an

open end 3 and having a first wall 4 and a second wall 5 and said bag having edges 6,6' connecting the closed and open ends of the bag wherein the edges are folded so as to cover each a longitudinal strip 7,7' of the first wall, said bag subsequently being folded so that the closed end of the first wall is parallel to the open end of the first wall to form the first compartment. The first compartment comprises an ostomy appliance 8 and is open in Figure 3 and closed in Figure 4 in which the first compartment is also sealed using an adhesive label 9. Figures 2 and 3 show stages one and two in a process for preparing a package of the invention comprising an ostomy appliance, figure 4 showing a third stage and figure 1 the finished package.

In a method of producing a package of the invention containing a disposable ostomy receiving bag, said package comprising a first compartment capable of accommodating a (fresh) ostomy receiving bag and a second compartment capable of accommodating a used ostomy receiving bag, said second compartment being sealable so as to confine the receiving bag, said method comprising in a first stage placing an ostomy appliance 8 on a bag 1 having a closed end 2 and an open end b and having a first wall 4 and a second wall 5 and said bag having edges 6,6' connecting the closed 2 and open 3 ends of the bag wherein the edges 6,6' are folded so as to cover each a longitudinal strip 7,7' of the first wall 4 and a part of the ostomy appliance 8, and then folding the closed end 2 of the first wall 4 of said bag so that is parallel to the open 3 end of the first wall and covers the folded strips and the ostomy appliance leaving the upper end of the bag forming a flap 10 to form the first compartment. Then, the first compartment closed by folding the flap 10 so that the first wall contacts the outer surface of the second wall 5, said compartment encasing an indicated ostomy receiving bag 8, the outer surface of the second wall and further being provided with an adhesive label 9 for closing the first compartment

When using the package of the invention, the ostomate breaks the seal of the flap, opens the first compartment and removes the fresh ostomy receiving bag for substituting the one in use. Then, the first compartment of the bag is unfolded

giving access to the full space of the package forming the second compartment. After detaching the used receiving bag from the abdomen or from an ostomy body side member, the bag may be placed in the second compartment with or without emptying the bag as is appropriate. Then the package is advantageously sealed by tying a knot on a part of the open end or using another suitable sealing means such as a clamp known per se for sealing an ostomy bag or an adhesive sealing which is preferably covered by a protecting release liner made from a suitable material such as polyethylene or a siliconised paper to be removed before use or a reusable adhesive placed on the flap. When a reusable adhesive is used on the flap, this may also be used for closing the second compartment in which the used receiving bag is then safely confined.

Claims

1. A package for a disposable ostomy receiving bag, said package comprising a first compartment capable of accommodating a (fresh) ostomy receiving bag and a second compartment capable of accommodating a used ostomy receiving bag, said second compartment being sealable so as to confine the receiving bag.
2. A package as claimed in claim 1 wherein the package is in the form of a bag having a closed end and an open end and having a first wall and a second wall and said bag having edges connecting the closed and open ends of the bag wherein the edges are folded so as to cover each a longitudinal strip of the first wall, said bag subsequently being folded so that the closed end of the first wall is parallel to the open end of the first wall to form the first compartment.
3. A package as claimed in claim 1 or 2 wherein the closed end of the bag, in its folded position, leaves a part of the open end of the bag free as a flap capable of covering the inlet opening of the compartment.
4. A package as claimed in claim 3 wherein the flap and the outer surface of the second wall forming the first compartment are provided with means for releasable attachment of the flap to the surface of the wall.
5. A package as claimed in any of claims 1 - 4 wherein the bag is made from a material being substantially impervious to odour.
6. A method of producing a package containing a disposable ostomy receiving bag, said package comprising a first compartment capable of accommodating a (fresh) ostomy receiving bag and a second compartment capable of accommodating a used ostomy receiving bag, said second compartment being sealable so as to confine the receiving bag, said method comprising placing an ostomy appliance on a bag having a closed end and an open end and having a first wall and a second wall and said bag having edges connecting the closed and open ends of

the bag wherein the edges are folded so as to cover each a longitudinal strip of the first wall and a part of the ostomy appliance, and then folding the closed end of the first wall of said bag so that is parallel to the open end of the first wall and covers the folded strips and the ostomy appliance to form the first compartment.

5

7. A method as claimed in claim 6 wherein the closed end of the bag, in its folded position, leaves a part of the open end of the bag free as a flap which is then folded to cover the inlet opening of the first compartment.

10

8. A method as claimed in claim 6 or 7, wherein the flap is secured to the outer surface of the second wall for closing the first compartment by means for releasable attachment of the flap to the surface of the wall.

Abstract**A Package for an Ostomy Appliance**

5

10 A package for a disposable ostomy receiving bag, said package comprising a first compartment capable of accommodating a (fresh) ostomy receiving bag and a second compartment capable of accommodating a used ostomy receiving bag, said second compartment being sealable so as to confine the receiving bag facilitates the handling of fresh and used bags and renders the user more independent of the availability of a lavatory.
